

Artificial caving systems provide a real sense of exploration, adventure, fun and challenge to participants of all ages. They can be designed and installed to suit any space, either internal or external.

Rockworks design and manufacture the caving systems using our simulated rock construction system which can recreate the physical environment of a natural cave system.

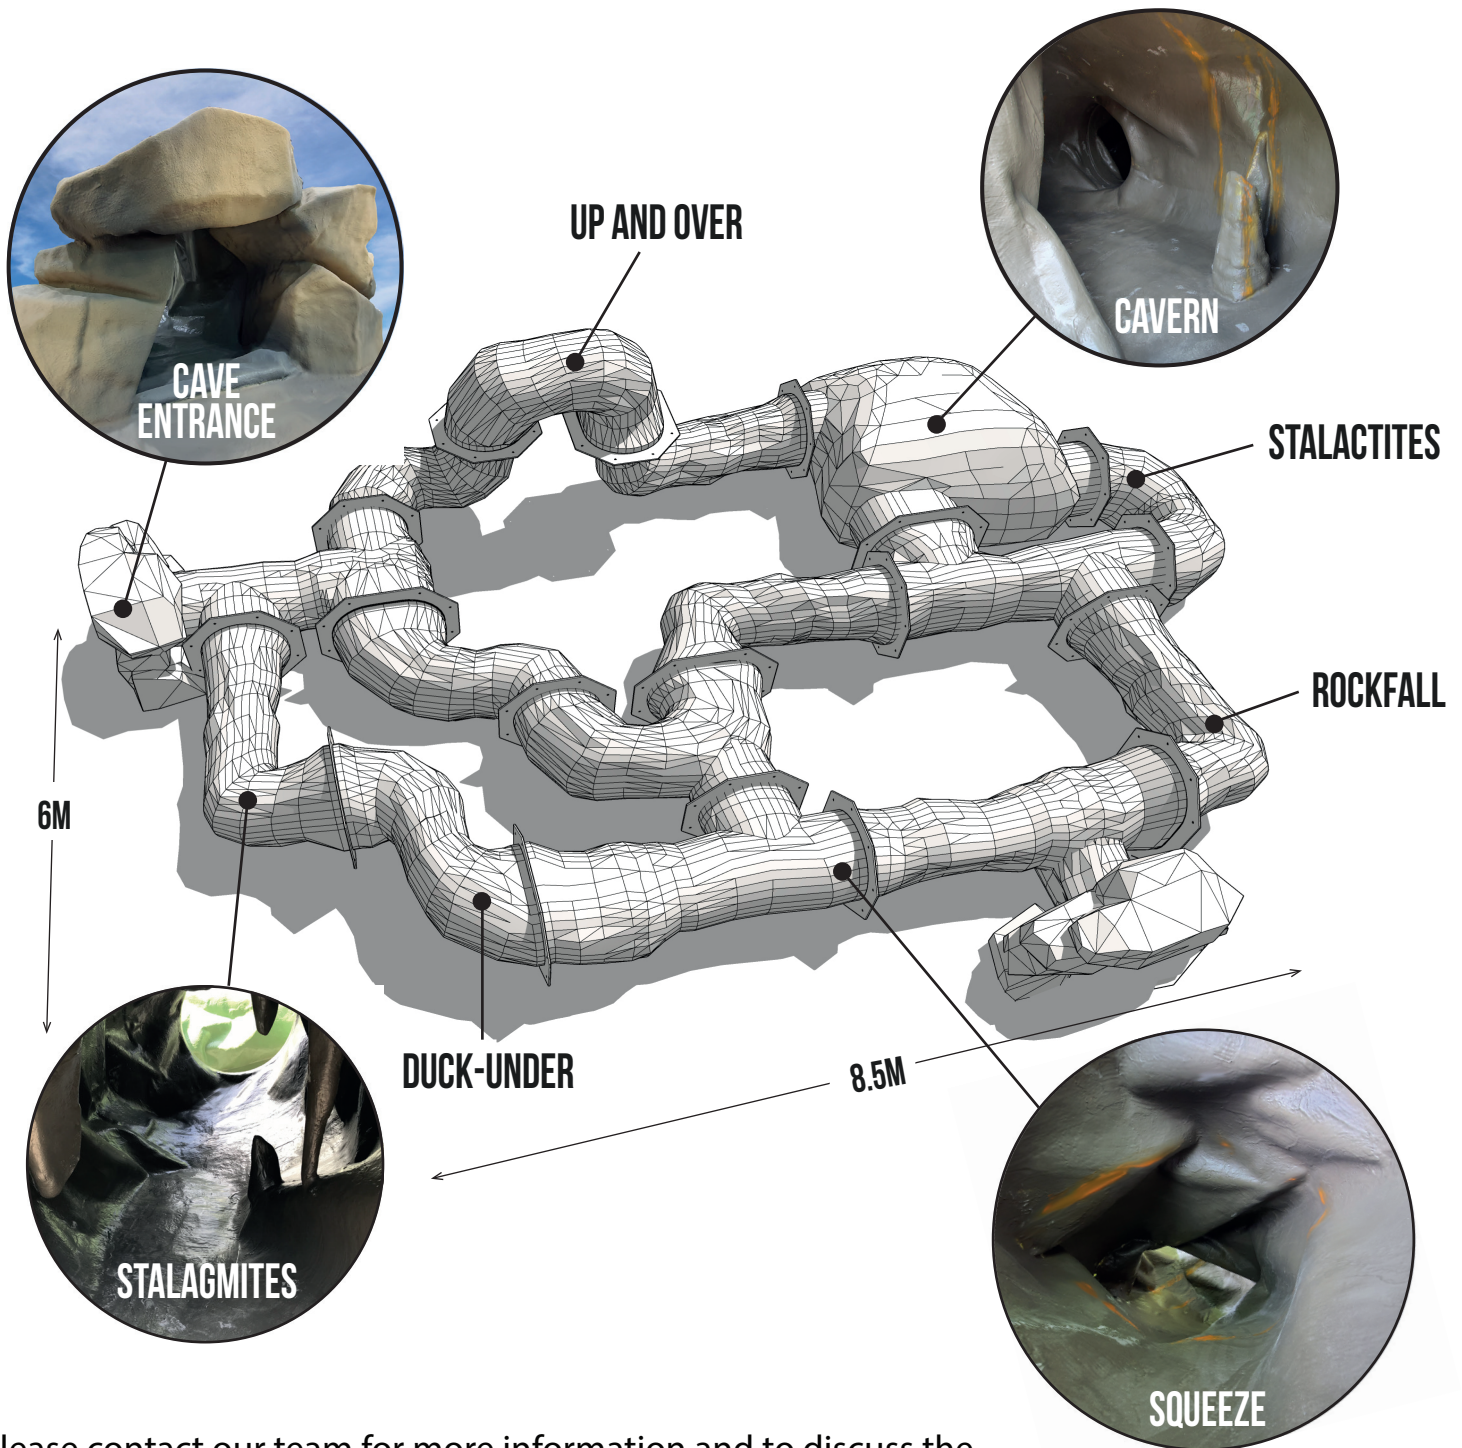

We provide an extensive range of caving features and challenges including stalactites and stalagmites, vertical and horizontal squeezes, internal chambers and sumps.

The systems are modular in design and construction, which allows for speedy installation and the systems are also reconfigurable and can be extended at any time.

Bespoke layouts mean that every project is custom made to each client's individual requirements to provide an exciting replication of real caving in a safe and controlled environment with escape hatches and optional LED lighting system.

Please contact our team for more information and to discuss the potential of installing a bespoke caving system.
